Office Action Summary

Application No.

09/892,225

Applicant(s)

YAMAZAKI ET AL.

Examiner

Matthew J. Song

Art Unit

1722

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 27 December 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 5-7, 15-19, 23, 29-31 and 35-54 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 5-7, 15-19, 23, 29-31 and 35-54 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/27/2005 has been entered.

Withdrawn Rejections

2. Applicant's arguments, see page 12-13 of the remarks, filed 12/27/2005, with respect to the rejection of Shimizu in view of Noguchi have been fully considered and are persuasive. The rejections of claims 5-7, 15-16, 19, 31, and 35-46 have been withdrawn.

Claim Rejections - 35 USC § 112

3. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

4. Claim 15 are 16 rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

Art Unit: 1722

Claim 15 requires the introduction of element into a first and second amorphous semiconductor after forming a second amorphous film. The specification does not provide support for introducing a promoter into both layers after forming the second layer. The specification only teaches introducing a promoter to either the first or the second, but not both. There is no support for introducing a promoter into both layers. Also, the specification does not provide support for providing a promoter through the second layer to introduce the promoter to the first layer. There is no support for introducing a promoter to the first layer after forming the second layer.

Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 1722

6. Claims 5-7, 15-17, 23, 29, and 35-41 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noguchi et al (JP 04-168769), where an English Translation has been provided, in view of Shimizu (US 5,753,541) or Tsutsu (US 6,118,151).

In a method of solid growth, Noguchi et al teaches an amorphous layer **2** made of SiGe or Ge is formed on a substrate **1** and an amorphous silicon layer **3** is formed on the layer **2**. Noguchi et al also teaches the solid growth temperature is lowered because of the sequentially laminated starting material. Noguchi et al also teaches amorphous layer is crystallized by heat treating for a predetermined time to form polycrystalline layers **21**, **31** (Abstract).

Noguchi et al teaches using a heat treatment to crystallize the amorphous SiGe and amorphous Si layer to polycrystalline layers. Noguchi et al does not teach crystallizing the amorphous films by irradiated with an excimer laser light.

In a method of fabricating a polycrystalline silicon-germanium thin film transistor (TFT), note entire reference, Shimizu teaches forming an amorphous silicon layer, an amorphous germanium layer and converting the amorphous silicon layer and the amorphous germanium layer into polycrystalline layers (col 3, ln 1-25). Shimizu also discloses the amorphous silicon and germanium layers are formed by plasma CVD (col 3, ln 26-40 and Example 2). Shimizu also discloses both of the amorphous layers are converted into polycrystalline layer by annealing using an ultraviolet laser light, such as an excimer laser (col 3, ln 41-67 and Example 3). Shimzu also discloses a source electrode **2** and a drain electrode **3** and an amorphous silicon film used as an ohmic contact layer **4**, this reads on applicant's insulating film covering an electrode, and thereafter forming an amorphous silicon and amorphous germanium layer, which are crystallized by laser light (col 5, ln 1-67). Shimzu also teaches the application of heat or light to promote

Art Unit: 1722

recrystallization of amorphous germanium will result in progress of recrystallization of the amorphous silicon layer at a lower temperature than that by conventional methods and laser annealing can be replaced with heating to a temperature greater than 600°C (col 3, ln 64 to col 4, ln 20 and col 6, ln 20-35), this is a teaching that the application of heat or light are equivalent methods of recrystallization of amorphous SiGe and Si layers.

It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify Noguchi et al's heat treatment by using an excimer laser annealing, as taught by Shimzu, because substitution of known equivalents for the same purpose is held to be obvious (MPEP 2144.06).

In a method of forming a semiconductor, note entire reference, Tsutsu teaches forming a semiconductor layer of $\text{Si}_x\text{Ge}_{1-x}$ ($0 < x < 1$) (col 2, ln 40-50). Tsutsu also teaches the semiconductor is annealing with an energy beam or heat treating at 550°C to recrystallize the amorphous semiconductor layer into a polycrystalline layer (Example 1, Example 2, and col 3, ln 65 to col 3, ln 45). Tsutsu teaches excimer laser light used to crystallize an amorphous silicon germanium film (col 4, ln 35-50).

It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify Noguchi et al's heat treatment by using an excimer laser annealing, as taught by Tsutsu, because substitution of known equivalents for the same purpose is held to be obvious (MPEP 2144.06).

The combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu teach all of the limitations of claim 5, as discussed previously, except the concentration of germanium is within a range of 0.1 atoms% to 10 atom%. Concentration is well known in the art

Art Unit: 1722

to be a result effective variable and Noguchi et al teaches the concentration of Germanium is a result effective variable, as evidenced in Figure 2. A lower germanium concentration would be desirable to limit the amount of impurities, which can diffuse through the device during high temperature processes. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu by optimizing the concentration of germanium to obtain the claimed range by conducting routine experimentation of a result effective variable.

Furthermore, where the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation. (In re Aller, 220 F.2d 454, 456, 105 USPQ 233, 235(CCPA 1955)).

7. Claims 19, 31, 43, and 46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noguchi et al (JP 04-168769), where an English translation has been provided, in view of Shimizu (US 5,753,541) or Tsutsu (US 6,118,151) as applied to claims 15-16 above, and further in view of Zhang et al (US 5,578,520).

The combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu teaches all of the limitations of claim 19, as discussed previously in claim 15. The combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu is silent to a CVD apparatus with a turbo molecular pump used in an exhaust means connected to a reaction chamber.

In a plasma CVD apparatus for depositing amorphous silicon, Zhang et al teaches a CVD apparatus 2, where a vacuum evacuation apparatus comprising a turbo molecular pump and a

Art Unit: 1722

rotary pump connected in series, so that impurity concentration inside the chamber may be maintained as low as possible (Fig 2 and col 6, ln 1-67). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al and Shimizu, or the combination of Noguchi et al and Tsutsu with Zhang et al to maintain the impurity concentration in the chamber as low as possible.

Also, Applicant is reminded apparatus limitations, unless they affect the process in a manipulative sense, may have little weight in process claims (In re Tarczy-Hornoch 158 USPQ 141).

8. Claims 18, 30, 42, and 45 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noguchi et al (JP 04-168769), where an English Translation has been provided, in view of Shimizu (US 5,753,541) or Tsutsu (US 6,118,151), as applied to claims 15-16 above, and further in view of Maekawa (US 6,066,547).

The combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu teaches all of the limitations of claim 18, as discussed previously. The combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu is silent to irradiating with a light from one selected from the group consisting of a halogen lamp, a xenon lamp, a mercury lamp, a metal halide lamp as a light source.

In a method of forming a thin film transistor, note entire reference, Maekawa teaches a transparent substrate of glass or quartz, a step 90 for providing an amorphous film, where silicon, germanium or silicon-germanium alloys are typical amorphous films, for forming a thin film transistor, a step 92 for depositing a layer of an amorphous film, a step 94 for introducing a

Art Unit: 1722

transition metal to induce rapid crystallization of the amorphous film and a step **96** for rapid thermal annealing to convert the amorphous film into a polycrystalline film (Fig 20 and col 11, ln 1-67). Maekawa also teaches the rapid thermal annealing step includes annealing with a tungsten-halogen lamp, Xe arc lamp and an excimer laser (col 12, ln 1-50). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al and Shimizu, or the combination of Noguchi et al and Tsutsu with Maekawa because substitution of known equivalents for the same purpose is held to be obvious (MPEP 2144.06).

9. Claims 15-17 and 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noguchi et al (JP 04-168769), where an English Abstract and English Translation have been provided, in view of Shimizu (US 5,753,541) or Tsutsu (US 6,118,151), and further in view of Applicant's Admitted Prior Art (Admission).

In a method of solid growth, Noguchi et al teaches an amorphous layer **2** made of SiGe or Ge is formed on a substrate **1** and an amorphous silicon layer **3** is formed on the layer **2**. Noguchi et al also teaches the solid growth temperature is lowered because of the sequentially laminated starting material. Noguchi et al also teaches amorphous layer is crystallized by heat treating for a predetermined time to form polycrystalline layers **21**, **31** (Abstract).

Noguchi et al teaches using a heat treatment to crystallize the amorphous SiGe and amorphous Si layer to polycrystalline layers. Noguchi et al does not teach crystallizing the amorphous films by irradiated with an excimer laser light.

In a method of fabricating a polycrystalline silicon-germanium thin film transistor (TFT), note entire reference, Shimizu teaches forming an amorphous silicon layer, an amorphous germanium layer and converting the amorphous silicon layer and the amorphous germanium layer into polycrystalline layers (col 3, ln 1-25). Shimizu also discloses the amorphous silicon and germanium layers are formed by plasma CVD (col 3, ln 26-40 and Example 2). Shimizu also discloses both of the amorphous layers are converted into polycrystalline layer by annealing using an ultraviolet laser light, such as an excimer laser (col 3, ln 41-67 and Example 3). Shimizu also discloses a source electrode 2 and a drain electrode 3 and an amorphous silicon film used as an ohmic contact layer 4, this reads on applicant's insulating film covering an electrode, and thereafter forming an amorphous silicon and amorphous germanium layer, which are crystallized by laser light (col 5, ln 1-67). Shimizu also teaches the application of heat or light to promote recrystallization of amorphous germanium will result in progress of recrystallization of the amorphous silicon layer at a lower temperature than that by conventional methods and laser annealing can be replaced with heating to a temperature greater than 600°C (col 3, ln 64 to col 4, ln 20 and col 6, ln 20-35), this is a teaching that the application of heat or light are equivalent methods of recrystallization of amorphous SiGe and Si layers.

It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify Noguchi et al's heat treatment by using an excimer laser annealing, as taught by Shimizu, because substitution of known equivalents for the same purpose is held to be obvious (MPEP 2144.06).

Referring to claim 15-16, the combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu does not teach introducing a metal element after

Art Unit: 1722

forming the second amorphous semiconductor film. Admission teaches a technique for forming a crystalline silicon film, by introducing a metal element, such as nickel, which promotes crystallization of silicon into an amorphous silicon film and fabricating a crystalline silicon film at a heat treatment lower than conventional temperature, note pages 3-4 of the specification, this reads on applicant's introducing a metal element after forming the second amorphous layer because the second amorphous layer is silicon. It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu by introducing a metal into the amorphous silicon and the amorphous silicon germanium layer to promote crystallization of the layers which are to be crystallized and reduce the heat treatment temperature, as taught by Admission.

10. Claims 19 and 31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noguchi et al (JP 04-168769), where an English Abstract and English Translation have been provided, in view of Shimizu (US 5,753,541) or Tsutsu (US 6,118,151) and further in view of Applicant's Admitted Prior Art (Admission) as applied to claims 15-16 above, and further in view of Zhang et al (US 5,578,520).

The combination of Noguchi et al, Shimizu and Admission or the combination of Noguchi et al, Tsutsu and Admission teaches all of the limitations of claim 19, as discussed previously in claim 15. The combination of Noguchi et al, Shimizu and Admission or the combination of Noguchi et al, Tsutsu and Admission is silent to a CVD apparatus with a turbo molecular pump used in an exhaust means connected to a reaction chamber.

Art Unit: 1722

In a plasma CVD apparatus for depositing amorphous silicon, Zhang et al teaches a CVD apparatus 2, where a vacuum evacuation apparatus comprising a turbo molecular pump and a rotary pump connected in series, so that impurity concentration inside the chamber may be maintained as low as possible (Fig 2 and col 6, ln 1-67). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al, Shimizu and Admission, or the combination of Noguchi et al, Tsutsu and Admission to maintain the impurity concentration in the chamber as low as possible.

Also, Applicant is reminded apparatus limitations, unless they affect the process in a manipulative sense, may have little weight in process claims (In re Tarczy-Hornoch 158 USPQ 141).

11. Claims 18 and 30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noguchi et al (JP 04-168769), where an English Abstract and English Translation have been provided, and Shimizu (US 5,753,541) or Tsutsu (US 6,118,151), and further in view of Applicant's Admitted Prior Art (Admission), in view of, as applied to claims 15-16 above, and further in view of Maekawa (US 6,066,547).

The combination of Noguchi et al, Shimizu and Admission, or the combination of Noguchi et al, Tsutsu and Admission teaches all of the limitations of claim 18, as discussed previously. The combination of Noguchi et al, Shimizu and Admission is silent to irradiating with a light from one selected from the group consisting of a halogen lamp, a xenon lamp, a mercury lamp, a metal halide lamp as a light source.

In a method of forming a Thin film transistor, note entire reference, Maekawa teaches a transparent substrate of glass or quartz, a step **90** for providing an amorphous film, where silicon, germanium or silicon-germanium alloys are typical amorphous films, for forming a thin film transistor, a step **92** for depositing a layer of an amorphous film, a step **94** for introducing a transition metal to induce rapid crystallization of the amorphous film and a step **96** for rapid thermal annealing to convert the amorphous film into a polycrystalline film (Fig 20 and col 11, ln 1-67). Maekawa also teaches the rapid thermal annealing step includes annealing with a tungsten-halogen lamp, Xe arc lamp and an excimer laser (col 12, ln 1-50). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al, Shimizu and Admission, or the combination of Noguchi et al, Tsutsu and Admission because substitution of known equivalents for the same purpose is held to be obvious (MPEP 2144.06).

12. Claims 47-54 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noguchi et al (JP 04-168769), where an English Translation has been provided, in view of Shimizu (US 5,753,541) or Tsutsu (US 6,118,151) as applied to claims 5-7, 15-17, 23, 29, and 35-41 above, and further in view of Kunii (JP 04-163910), an English Abstract has been provided, or further in view of Cho (JP 11-340473), an English Abstract has been provided.

The combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu teaches all of the limitations of claim 47, as discussed previously in claim 5. The combination of Noguchi et al and Shimizu, or the combination of Noguchi et al and Tsutsu is silent to patterning before crystallizing.

In a method of forming a semiconductor device, Kunii teaches an amorphous si thin film is formed and etched into a pattern for a thin film transistor. Kunii also teaches the film is subjected to laser annealing (Abstract). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu by patterning after forming the layers, as taught by Kunii to form a plurality of semiconductor devices on a single wafer.

In a method of forming a thin film transistor, Cho teaches an amorphous si thin film is formed and subjected to specified etching before polycrystallizing by laser annealing, this reads on applicant's patterning (Abstract). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu by patterning after forming the layers, as taught by Cho, to form a plurality of semiconductor devices on a single wafer.

13. Claims 49-50 are rejected under 35 U.S.C. 103(a) as being unpatentable over Noguchi et al (JP 04-168769), where an English Abstract and English Translation have been provided, in view of Shimizu (US 5,753,541) or Tsutsu (US 6,118,151), and further in view of Applicant's Admitted Prior Art (Admission) as applied to claims 5-7, 15-17, 23, 29, and 35-41 above, and further in view of Kunii (JP 04-163910), an English Abstract has been provided, or further in view of Cho (JP 11-340473), an English Abstract has been provided.

The combination of Noguchi et al, Shimizu and Admission or the combination of Noguchi et al, Tsutsu and Admission teaches all of the limitations of claim 49, as discussed

Art Unit: 1722

previously in claim 15. The combination of Noguchi et al, Shimizu and Admission or the combination of Noguchi et al, Tsutsu and Admission is silent to patterning before crystallizing.

In a method of forming a semiconductor device, Kunii teaches an amorphous Si thin film is formed and etched into a pattern for a thin film transistor. Kunii also teaches the film is subjected to laser annealing (Abstract). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu by patterning after forming the layers, as taught by Kunii to form a plurality of semiconductor devices on a single wafer.

In a method of forming a thin film transistor, Cho teaches an amorphous Si thin film is formed and subjected to specified etching before polycrystallizing by laser annealing, this reads on applicant's patterning (Abstract). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Noguchi et al and Shimizu or the combination of Noguchi et al and Tsutsu by patterning after forming the layers, as taught by Cho, to form a plurality of semiconductor devices on a single wafer.

Double Patenting

14. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Art Unit: 1722

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

15. Claims 5-7, 15-16, 19, 31, and 35-54 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1, 7, 50-51, 59-60, 66 of U.S. Patent No. 6,482,684 in view of Noguchi et al (JP 04-168769), where an English Abstract and English Translation have been provided, and Applicant's Admitted Prior Art (Admission). Although the conflicting claims are not identical, they are not patentably distinct from each other because the difference between the claims of the instant application and US 6,482,684 is the instant claims first amorphous layer comprising germanium and a second amorphous semiconductor layer, where US 6,482,684 claims an amorphous semiconductor film and forming a film comprising germanium, which is inherently amorphous because the film is formed on an amorphous film using conventional deposition techniques, i.e. plasma CVD.

US 6,482,684 also does not claim a silicon and germanium containing film wherein a concentration of germanium is within a range of 0.1 atom% to 10 atom% or the silicon layer is formed on a Silicon Germanium layer.

In a method of solid growth, Noguchi et al teaches a first amorphous layer 2 made of SiGe or Ge is formed on a substrate 1 and a second amorphous silicon layer 3 is formed on the layer 2. Noguchi et al also teaches the solid growth temperature is lowered because of the sequentially laminated starting material (Abstract). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify US 6,482,684 by using the sequentially laminated amorphous SiGe and amorphous Si layers taught by Noguchi et al to lower the solid growth temperature of the amorphous Si layer, which is desirable.

Art Unit: 1722

The combination of US 6,482,684 and Noguchi et al teaches all of the limitations of claim 5, as discussed previously, except the concentration of germanium is within a range of 0.1 atoms% to 10 atom%. Concentration is well known in the art to be a result effective variable and Noguchi et al teaches the concentration of Germanium is a result effective variable, as evidenced in Figure 2. A lower germanium concentration would be desirable to limit the amount of impurities, which can diffuse through the device during high temperature processes. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of US 6,482,684 and Noguchi et al by optimizing the concentration of germanium to obtain the claimed range by conducting routine experimentation of a result effective variable.

Referring to claim 15-16, the combination of US 6,482,684 and Noguchi et al does not teach introducing a metal element after forming the second amorphous semiconductor film. Admission teaches a technique for forming a crystalline silicon film, by introducing a metal element, such as nickel, which promotes crystallization of silicon into an amorphous silicon film and fabricating a crystalline silicon film at a heat treatment lower than conventional temperature, note pages 3-4 of the specification, this reads on applicant's introducing a metal element after forming the second amorphous layer because the second amorphous layer is silicon. It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of US 6,482,684 and Noguchi et al by introducing a metal into the amorphous silicon to promote crystallization and reduce the heat treatment temperature, as taught by Admission.

Referring to claims 19 and 31, Applicant is reminded apparatus limitations, unless they affect the process in a manipulative sense, may have little weight in process claims (In re Tarczy-Hornoch 158 USPQ 141).

Referring to claim 42-54, patterning is obvious in the semiconductor industry to obtain a plurality of independent product within a single wafer.

Response to Arguments

16. Applicant's arguments with respect to claims 5-7, 15-19, 23, 29-31 and 35-54 have been considered but are moot in view of the new ground(s) of rejection.

17. Applicant's arguments filed 12/27/2005 have been fully considered but they are not persuasive.

Applicant's argument that heat treatment and laser annealing are not equivalent means for crystallization is noted but is not found persuasive. Applicant alleges that because a germanium layer efficiently absorbs UV rays using a germanium layer, the method is not equivalent to a heat treatment which does not require a germanium layer. This is not persuasive because a germanium layer is not required to crystallize an amorphous silicon layer, note column 1, lines 40-65 of Fujiwara (US 5,879,976). The presence of germanium allows the recrystallization to occur at a lower temperature, however recrystallization is still capable of crystallizing amorphous silicon without germanium.

Applicant's argument that a person of ordinary skill in the art would not have been motivated to replace the heat treatment with laser annealing because a desired absorption would not be achieved is noted but is not found persuasive. While the concentration of germanium does

Art Unit: 1722

influence the absorption of the laser, laser recrystallization can still be achieved with low levels of germanium. Tsutsu teaches laser recrystallization for $\text{Si}_x\text{Ge}_{1-x}$ ($0 < x < 1$); therefore laser recrystallization of silicon germanium films with germanium concentrations near zero are known and it would have been obvious to a person of ordinary skill in the art at the time of the invention to using a laser instead of a heat treatment to crystallize the SiGe film.

Applicant's argument that the prior art does not teach introducing a promoter into both layers is noted but is not found persuasive. The prior art teaches supplying a reaction promoter to an amorphous Si layer to reduce the crystallization layer; therefore it would have been obvious to a person of ordinary skill in the art at the time of the invention to introduce a promoter into all of the layers that were intended to be crystallized, namely both the first and second amorphous layers.

Applicant's argument regarding the double patenting rejection is noted but is not found persuasive. Applicant alleges that Noguchi does not teach or suggest the concentration parameter. Clearly in Figure 2 germanium concentration affects the crystallization temperature. Therefore concentration does affect the process, and is a result effective variable. Also, concentration of germanium will affect the electrical properties of the layer; therefore optimization of germanium concentration would have been obvious to a person of ordinary skill in the art. Although, Noguchi teaches a high concentration to obtain a lower crystallization temperature, lower concentrations would have been obvious to a person of ordinary skill in the art would desired a predetermined electrical properties and a lowering of the crystallization temperature.

Conclusion

Art Unit: 1722

18. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Fujiwara (US 5,879,976) teaches an amorphous Si film crystallized using laser annealing (col 5, ln 40-65).
